Message nest Auross the English Channel - Signals Parfectly R. cordeq-The Me had.

LONDON, March 28. Gugliolmo Marconi, the inventor, who recently, after long delay, obtained permission lish a station on the French coast for the purpose of experimenting with and France, announced that he has Shore Michigan Southern, Chicago and ably 800 people attended the reception, conducted successfully experiments be. Northwestern, Union Pacific and the Kent, and Boulogne.

The Times this morning prints a hundred-word dispatch, the first press periments between the South Foreland and Boulogne. The experiments were conducted with the Morse code, which was read as distinctly as if the termini had been connected with wires.

The South Foreland is the most easterly hand in England, consisting of a chalky sliff about 200 feet in height, projecting into the North sea and hav ing two lighthouses, with an elevation of 372 feet. Marconl's system of wire-less telegraphy has been in practical operation off the English coast for several months between the South Fore-land lighthouse and the East Goodwin lightship, a distance of twelve miles.

The distance from South Foreland lighthouse to Boulogne-Sur-Mer is thirty-two miles, the greatest previous distance covered having been eighteen miles, between Poole and Bournemouth, in England. An experience of fourteen months had shown that no kind of weather would stop the working of the apparatus. The vertical conductor Marconi used is the main feat-ure of his system, and he has found that the distance to which signals may be sent varies according to the square the length of this conductor. signaling eighteen miles he used a conductor eighty feet high, and in his apof Dover and even go that distance ten!

His experiments have aircady proved that when such a vertical wire or conductor is employed, no hindrance to signaling is caused by hills or other obstacles or by the curvature of the

Sucz tanal direct to Aumiral Dewey.

All the coal used by the first under his command, as well as that sent to Honolitic, is shipped cheely from the Atlantic seaboard principally from Baltimore or Newport News. Since the close of the war 40,000 tons have been sent to Manilla on steamers and salling vessels, the former proceeding through the Sucz Canal and the latter around the Cape of Good Hope. The trip through the canal takes nearly two months, while that around the Cape covers nearly five months. All coal sent to Honolity goes in salling ships around the Horn. It has been suggested that coal might be taken from the Pacific coast, but tests made two years ago by the Bureau of Equipment of coal mined on the Slope shows that the variety is far inferior to that coming from the East. Some little coal was purchased in Australia and sent is some right and the other wrong? Or Manilla for the fieet, but little compared to the vast quantities sent from this country.—Ex.
